Seznam prosojnic predavanja: Šum v radijskih komunikacijah

Peta mednarodna konferenca Solvay uglednih fizikov in kemikov na temo „Elektroni in fotoni“ (oktober 1927). Najuglednejša udeleženca Albert Einstein in Niels Bohr se nista razumela:

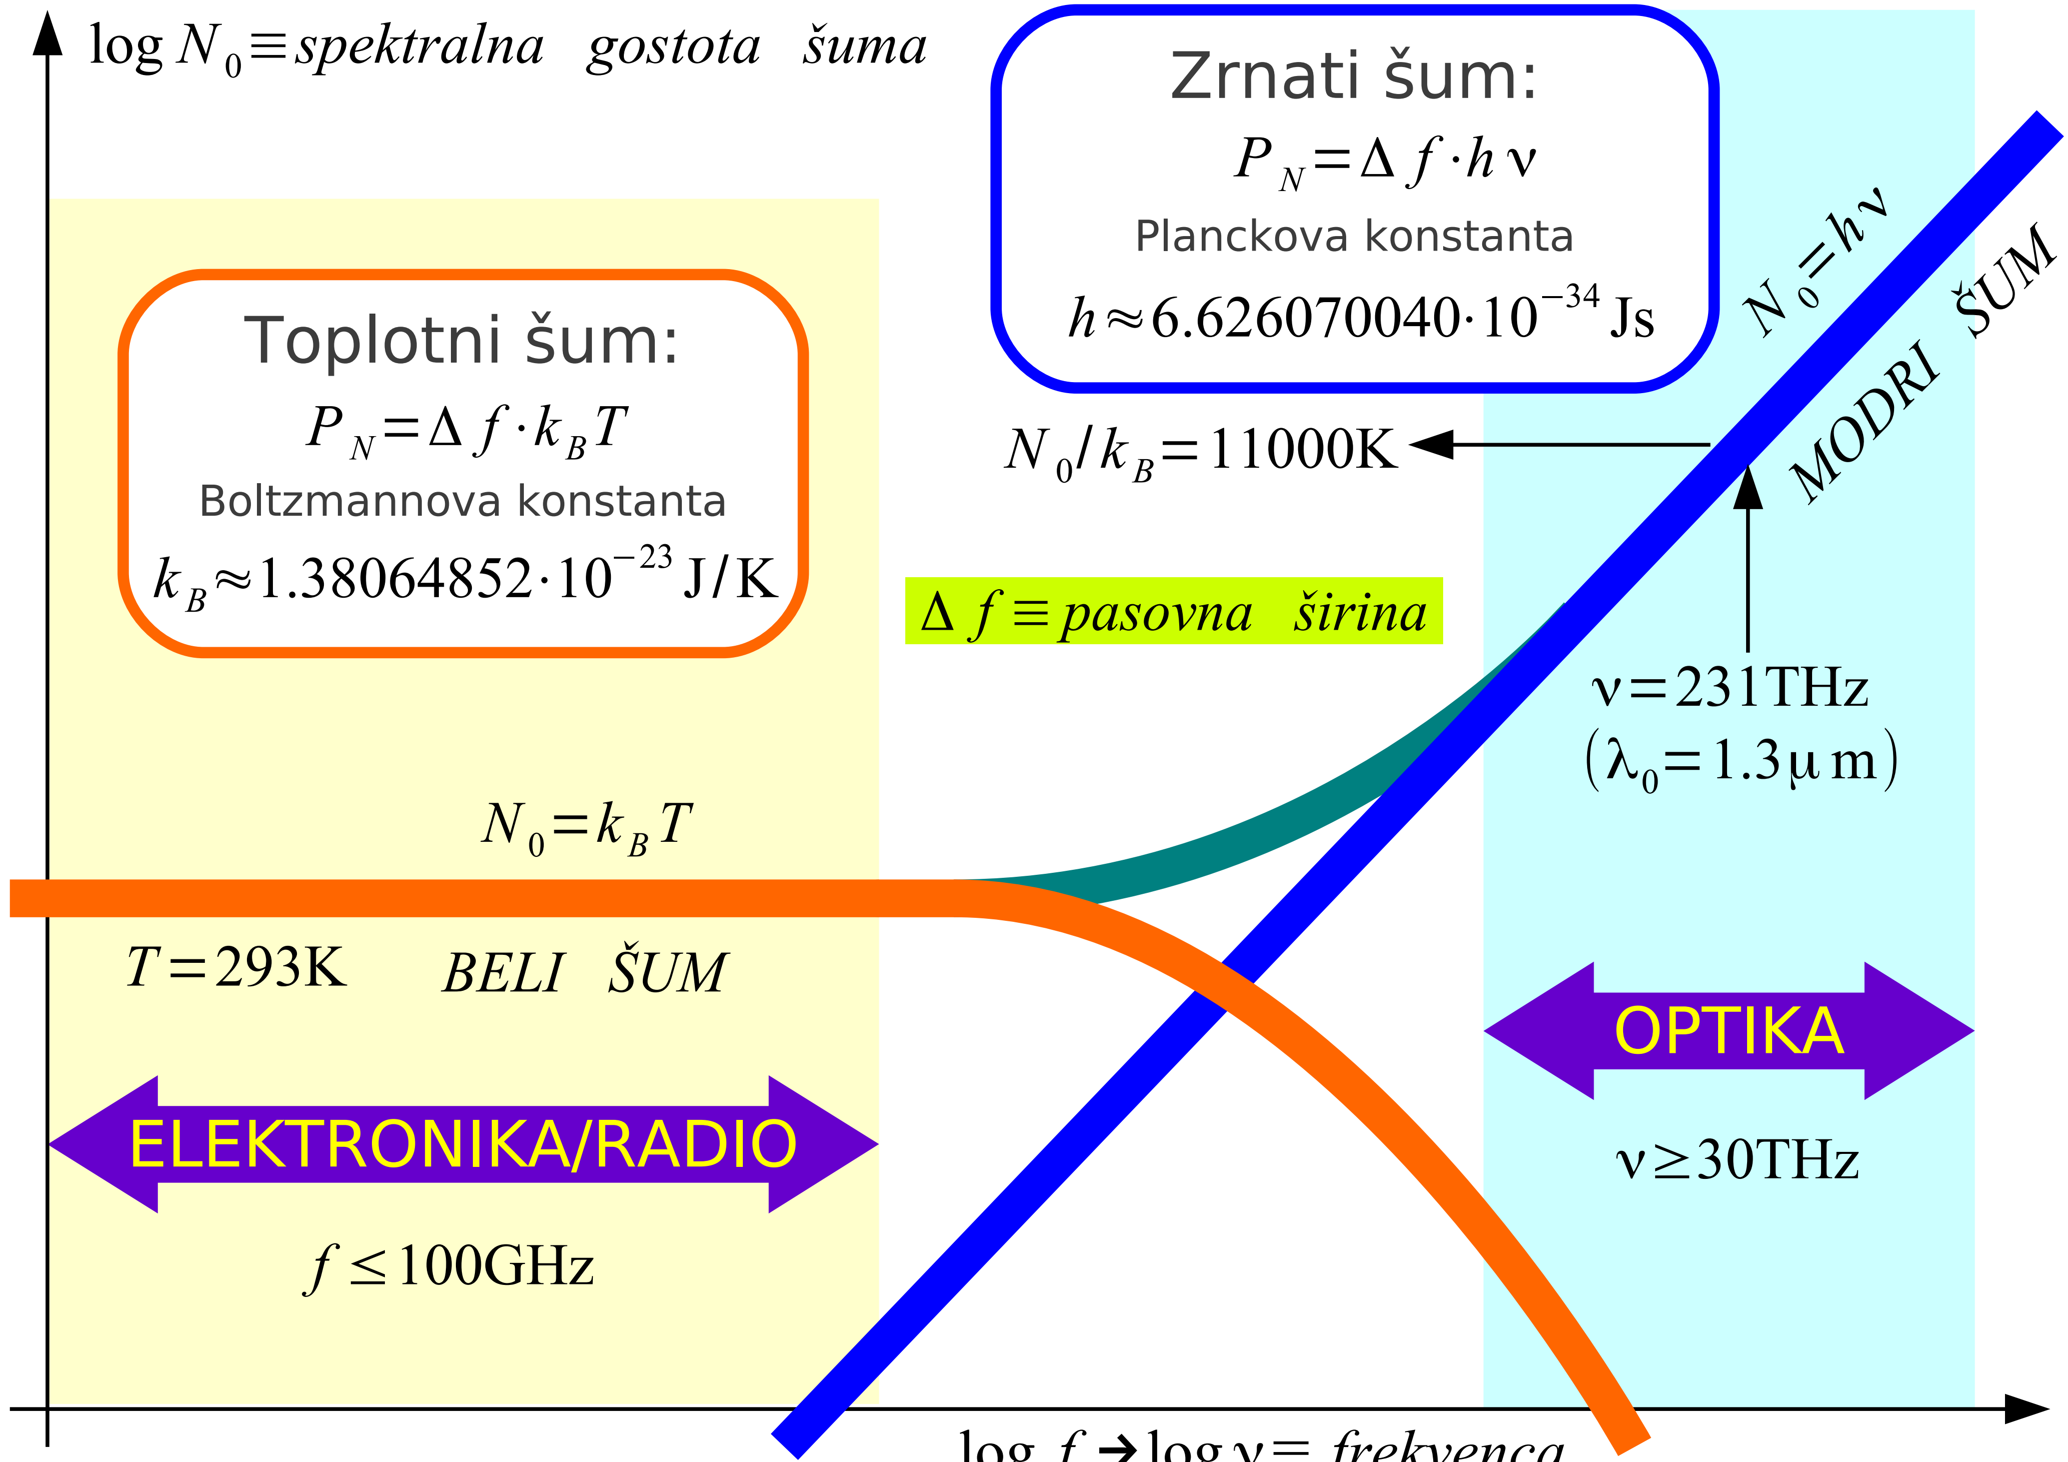
Albert Einstein: „God does not play dice!“
(Bog ne kocka! Torej ne dopušča naključnosti v naravnih zakonih.)

Niels Bohr: „Einstein, stop telling God what to do!“ (Einsten, nehaj učiti Boga, kaj naj počne!)

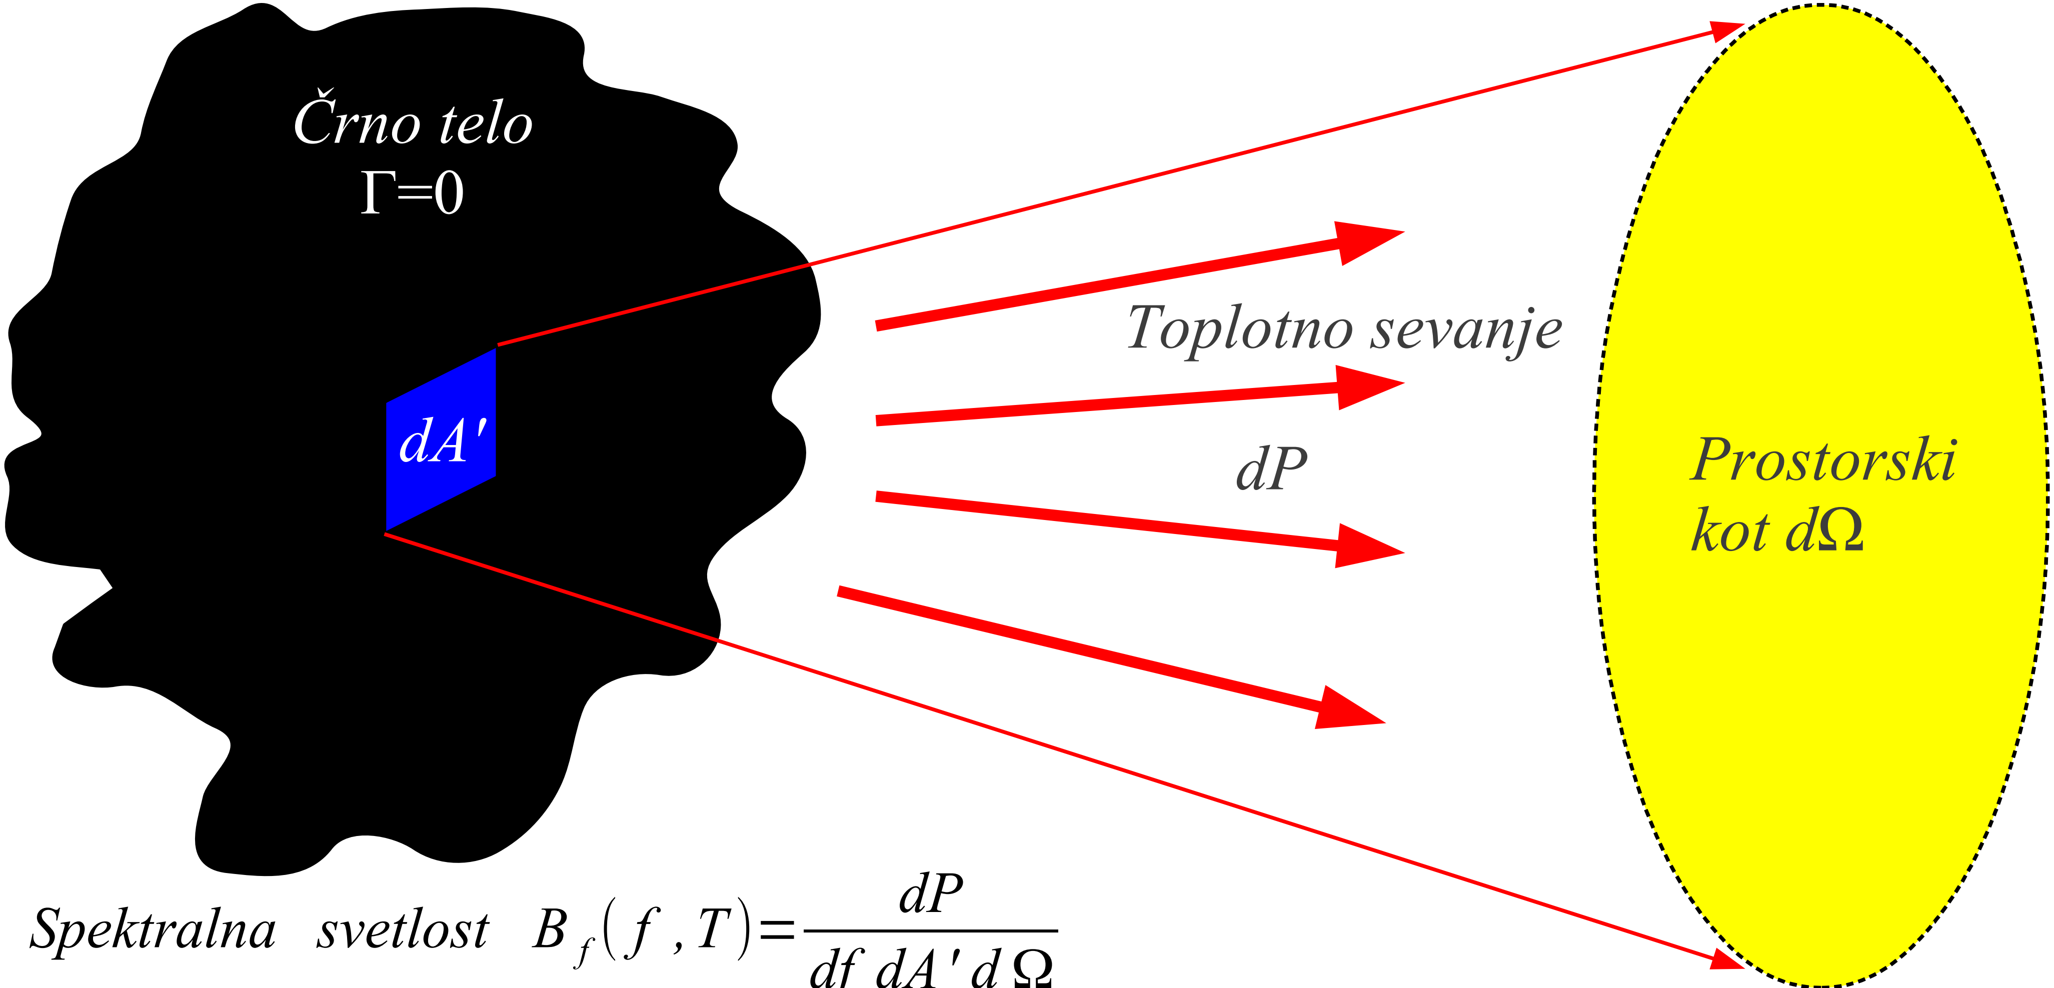
V telekomunikacijah naključnost imenujemo šum. Šum omejuje domet vsake zveze.

Šum je makroskopski opis kvantnih pojavov!

1 - Nesporazum slavnih znanstvenikov



2 - Spektralna gostota šuma



$$Spektralna\quad svetlost\quad B_f(f,T)=\frac{dP}{df\,dA'\,d\Omega}$$

Različni izvori šuma so med sabo nekorelirani, zato seštevamo moči šuma oziroma temperature šuma!

$$P_S' = G_3 G_2 G_1 P_S$$

Nesmiselna definicija šumnega števila:

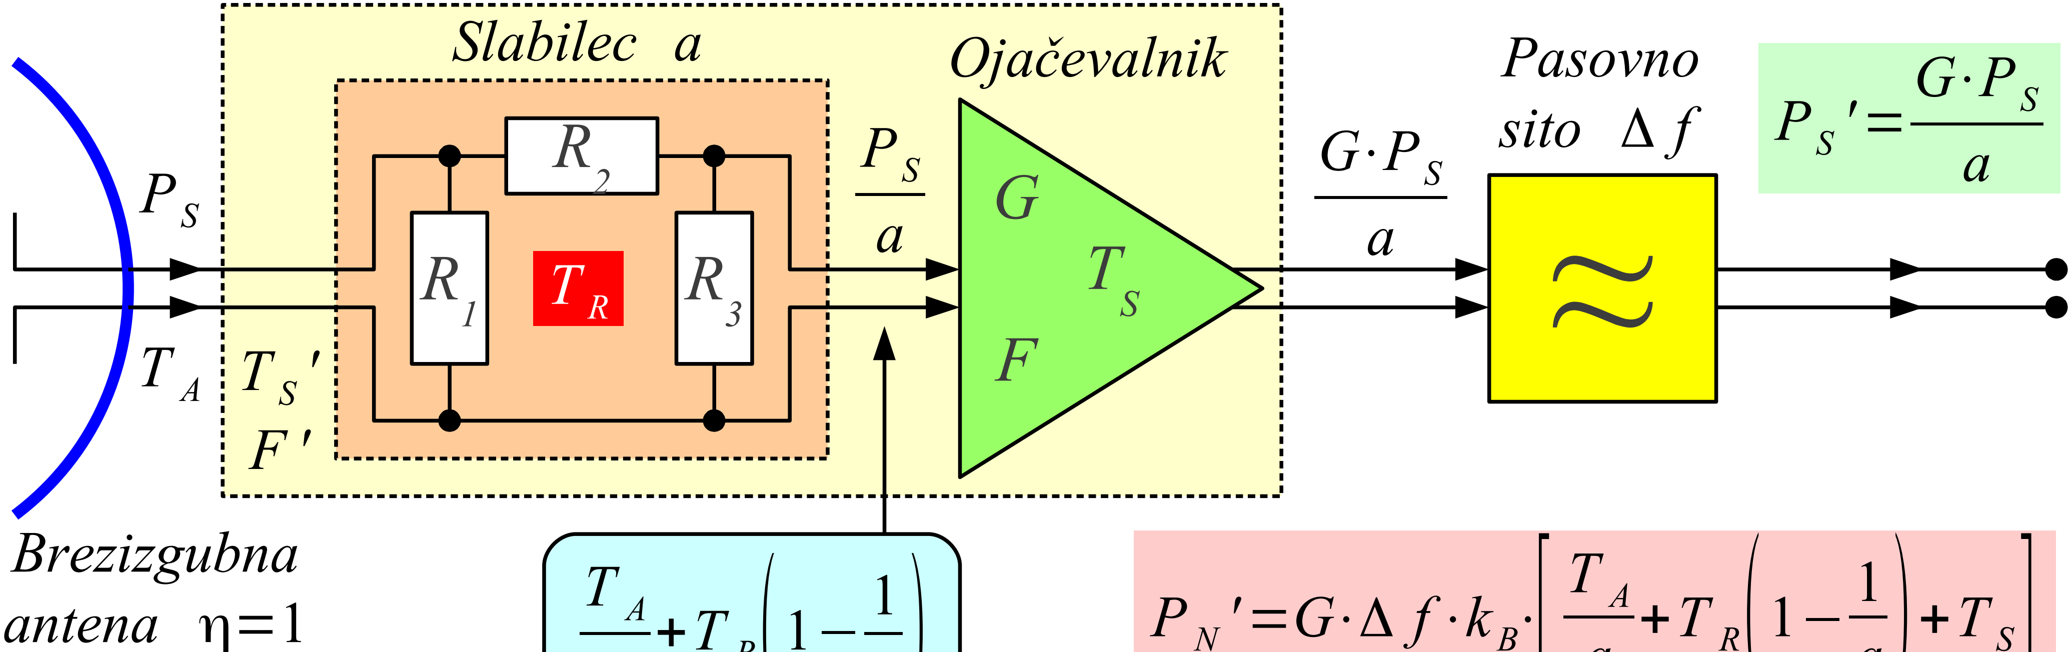
$$T_0 = 290\mathrm{K}$$

12 – Povezava F<->T



$$P_S' = \frac{G\cdot P_S}{a}$$

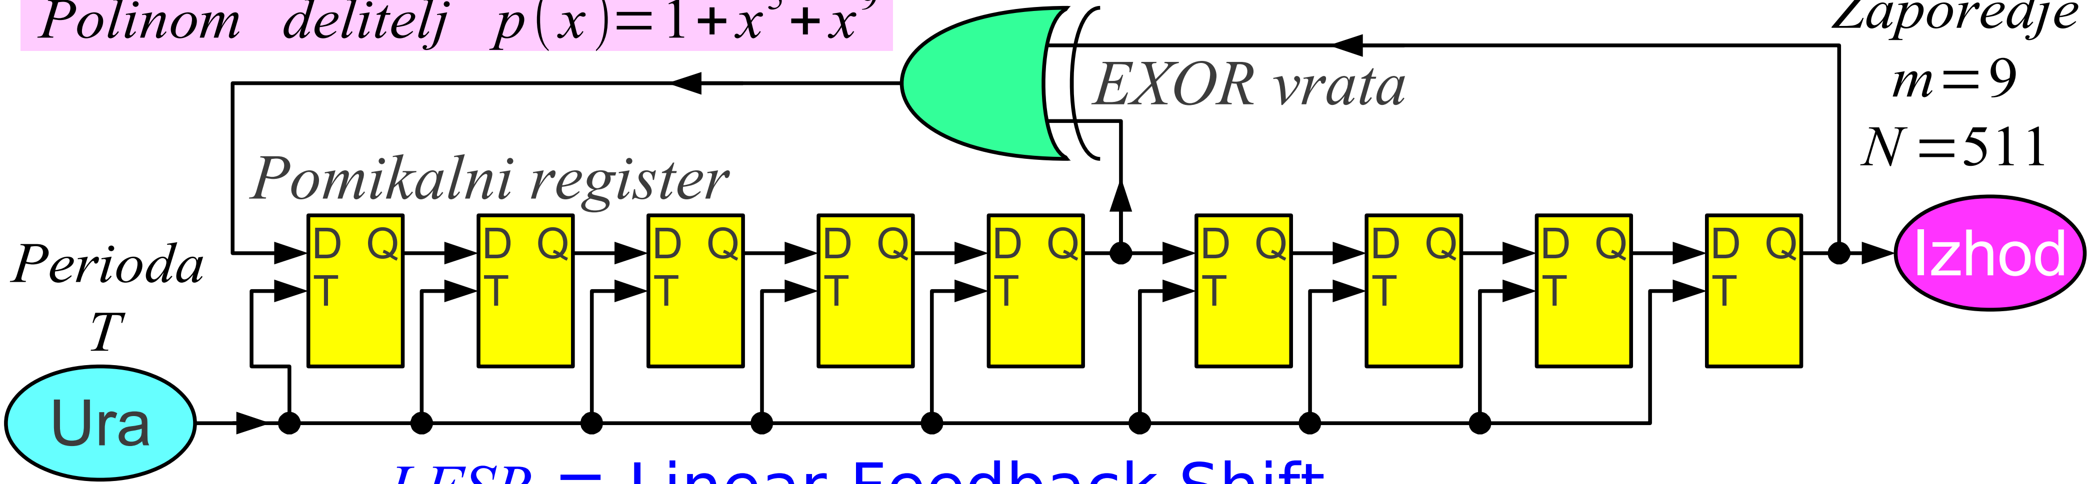
Polinom delitelj $p(x)=1+x^5+x^9$



LFSR ≡ Linear-Feedback Shift Register

Nerazcepni polinom $p(x)=1+x^l+x^m$ → *zaporedje dolžine max* $N=2^m-1$

2^{m-1} enic in $2^{m-1}-1$ ničel razporejenih v skupine

1X m enic, m-1 ničel

1X m-2 enic in ničel

2X m-3 enic in ničel

4X m-4 enic in ničel

36 – Psevdonaključna zaporedja LFSR

Avtokorelacija ima dve vrednosti z enim samim izrazitim vrhom:
- zaporedja za sinhronizacijsko glavo podatkovnih okvirjev
- razširitvena zaporedja v CDMA
- natančen prenos časa v radionavigaciji (GPS, GLONASS)

Brezhiben spekter enako velikih, enakomerno razmaknjenih črt ter preprosto proizvajanje/preverjanje:
- preizkusni podatki za vse vrste zvez v telekomunikacijah
- skrambliranje (randomization) podatkov kot linijsko kodiranje

Razmerje vršna moč / povprečje:

$$LFSR: \frac{P_{MAX}}{\langle P \rangle} \approx 1 \qquad Šum: \frac{P_{MAX}}{\langle P \rangle} \to \infty$$

Psevdonaključna zaporedja LFSR nimajo kriptološke vrednosti: algoritem Berlekamp-Massey 1969
